

Samples of Opportunity:

Add Ocean Acidification Measurements to your Research Project

The Ocean Acidification Research Center (OARC) is accepting proposals from current UAF students to add ocean acidification (OA) measurements to their research projects. OA data can be applied to interdisciplinary research areas including aquaculture, environmental change, fisheries, marine biology, natural resource management, and oceanography.

Interested students should submit a one-page proposal outlining the project's main goals and fieldwork schedule to collect up to 20 discrete samples to be run at the OARC free of charge. Those new to OA and seawater sampling should contact the OARC beforehand. Proposals are due one month before the project will begin.

Awarded students located in Fairbanks are expected to participate in some lab activities. All students will present their results to the OARC.
