

A photograph of a boat on a lake with mountains in the background. The boat is a small, light-colored motorboat with a Honda outboard motor. It is positioned in the foreground, and the lake extends to the horizon. The mountains are visible in the distance under a clear sky. The text is overlaid on the image.

# Investigating the Spatial Variability of Carbon Stabilization with Metals in Toolik Lake Sediments

## Carbon storage in Arctic lakes

---

- Lake sediments are large reservoirs for carbon
- Permafrost thaw causes an influx of organic carbon
- Carbon stabilization with iron (Fe) oxides
  - Manganese (Mn) oxides

# Carbon stabilization in Arctic lake sediments

# Questions

1. Are metals stabilizing organic carbon or fueling heterotrophic respiration in lake surface sediments?

2. How is the carbon that reaches the lakebed altered biologically and chemically?

# Toolik Lake

- 10 sites in total
- 5 sites sampled in 2022
- 6 sites samples in 2024
- Site 8 sampled both years

# Methods

HTH Gravity Corer

Core liners

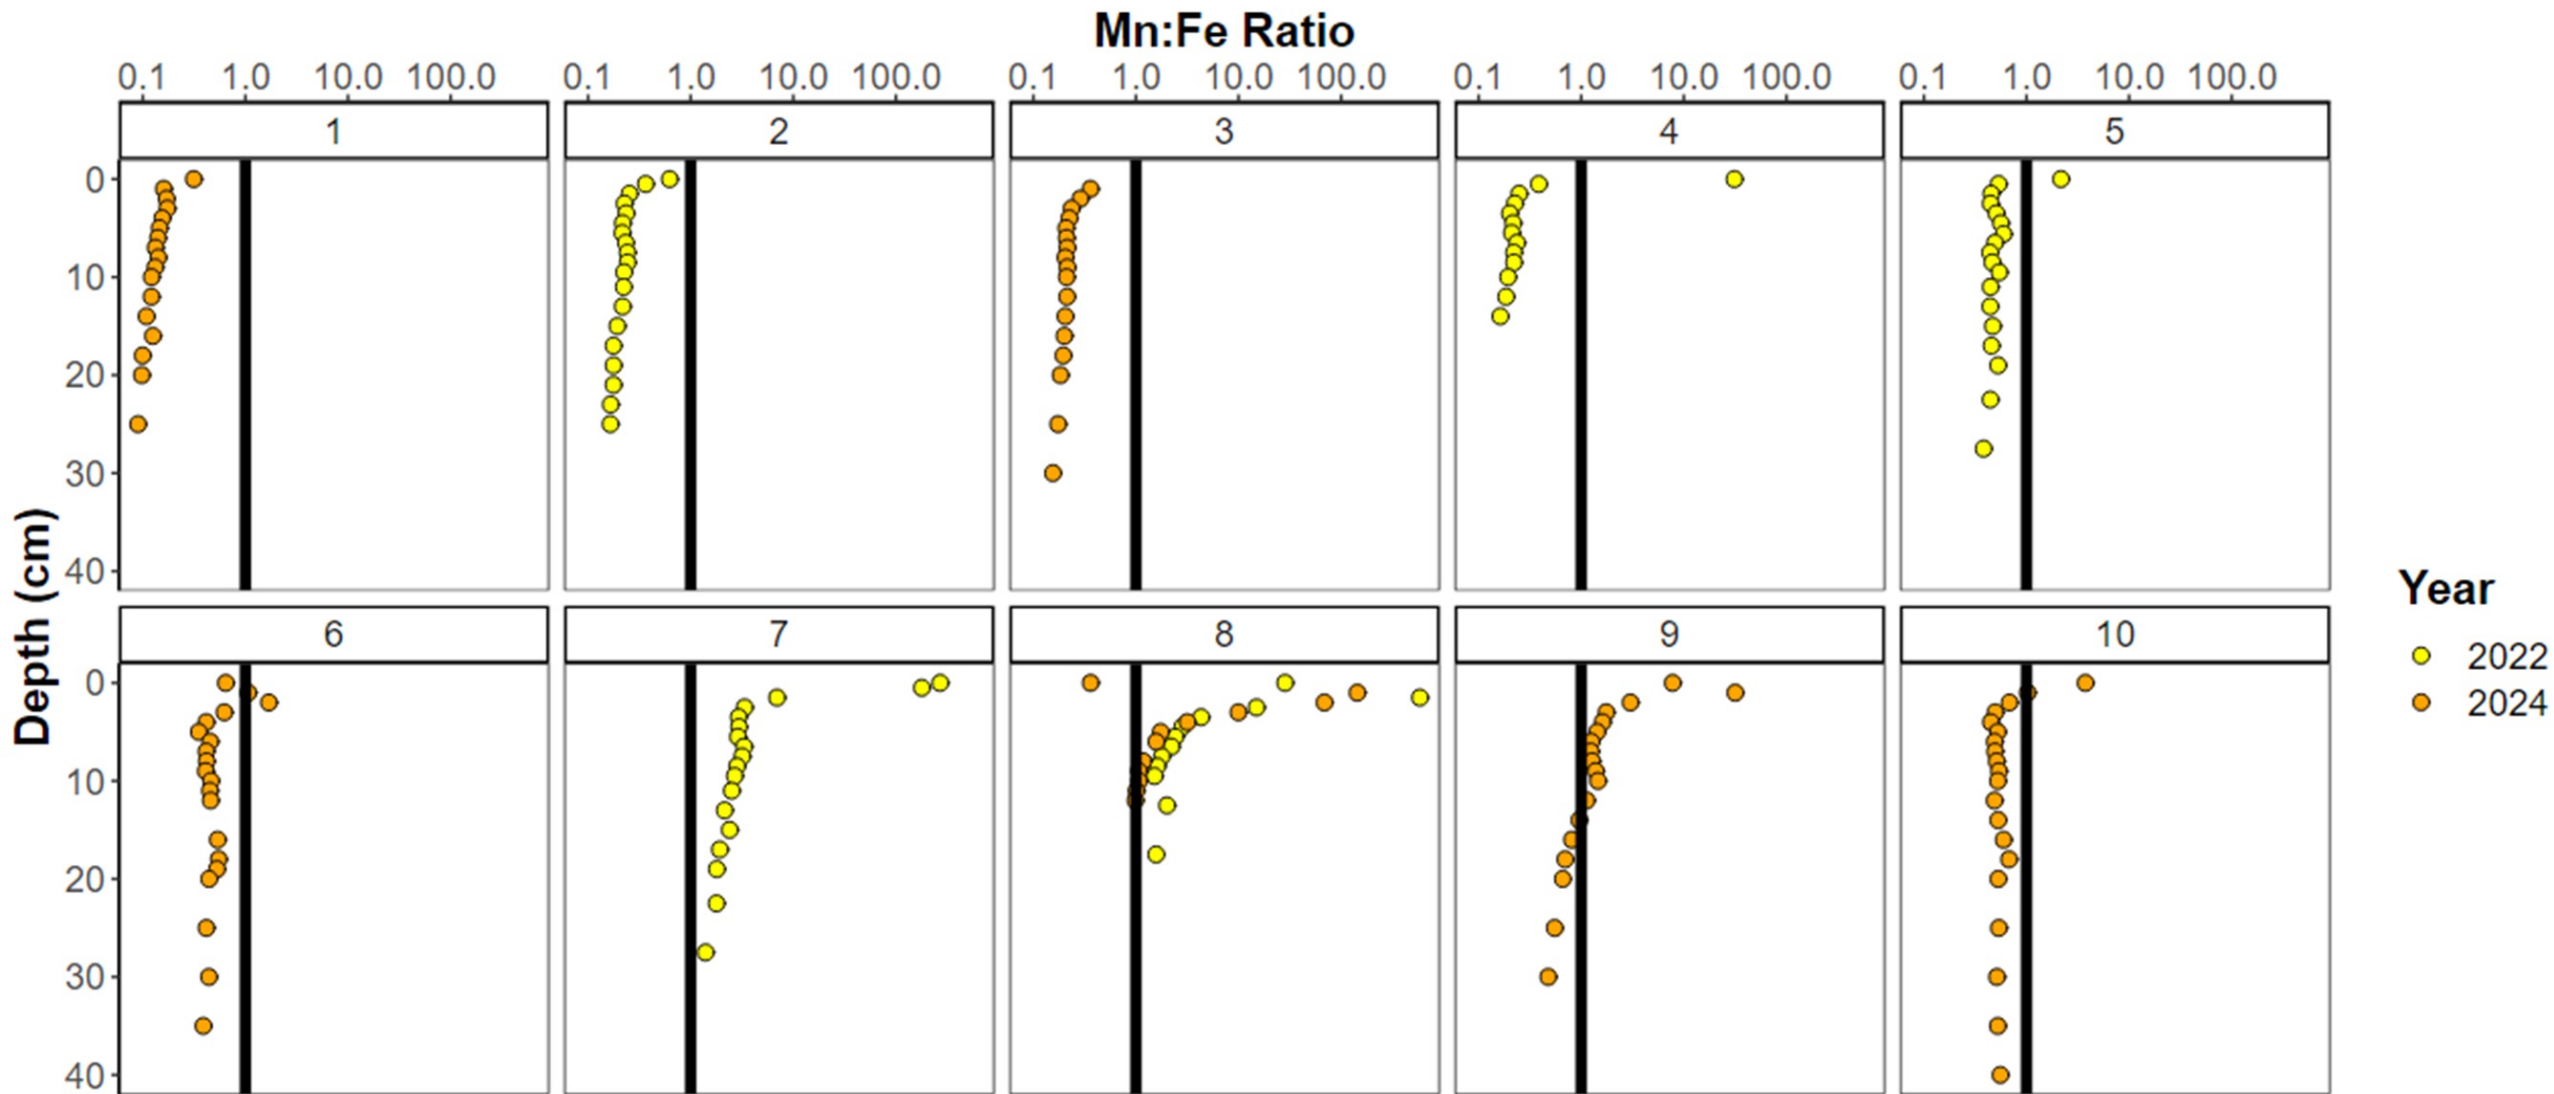

Slicing

# Sediment Sampling

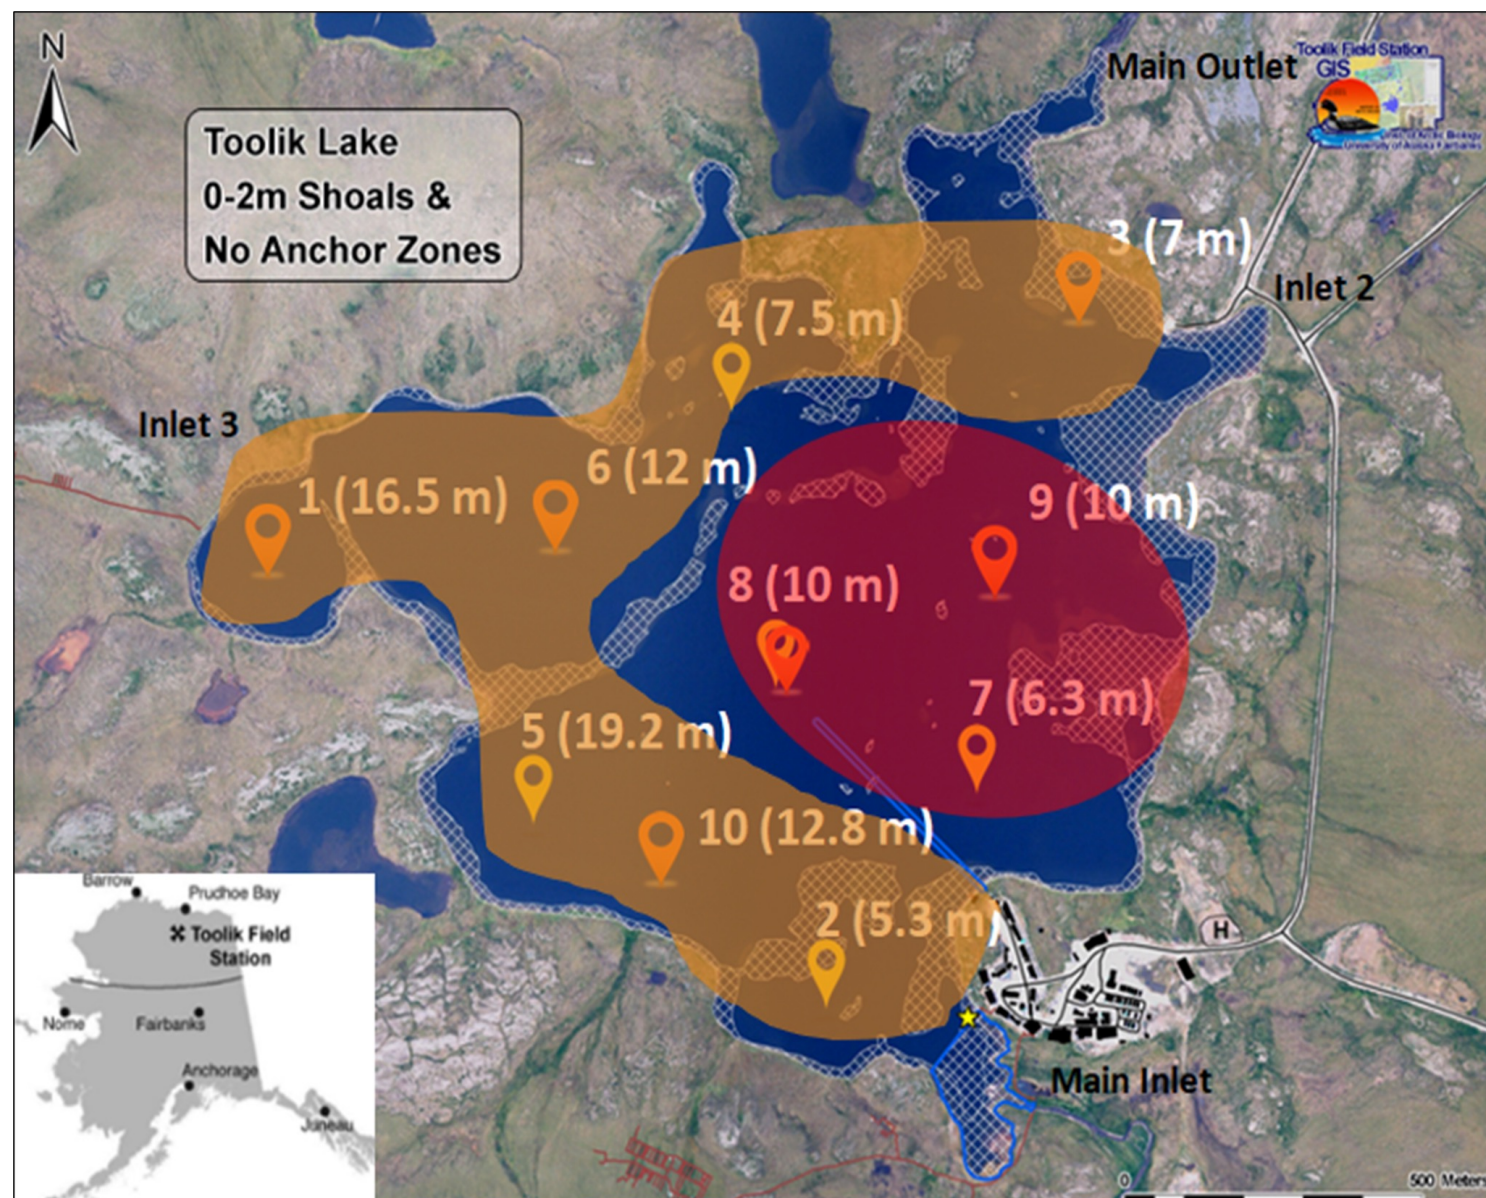

# Porewater Sampling

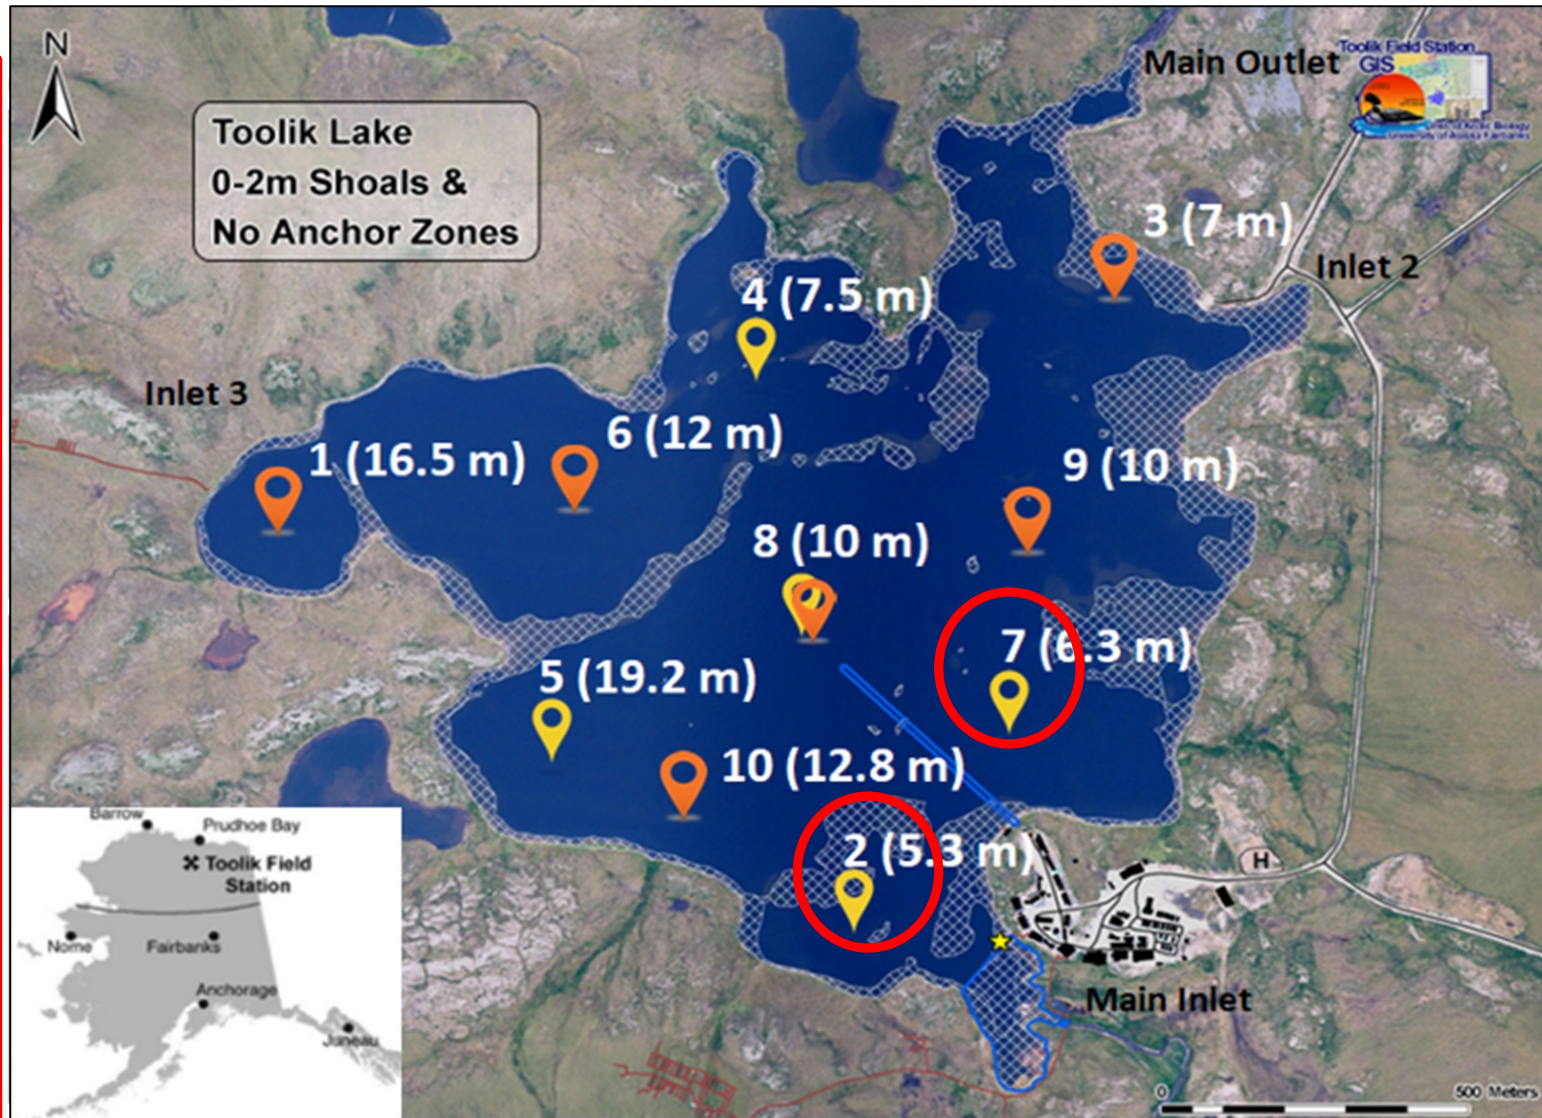

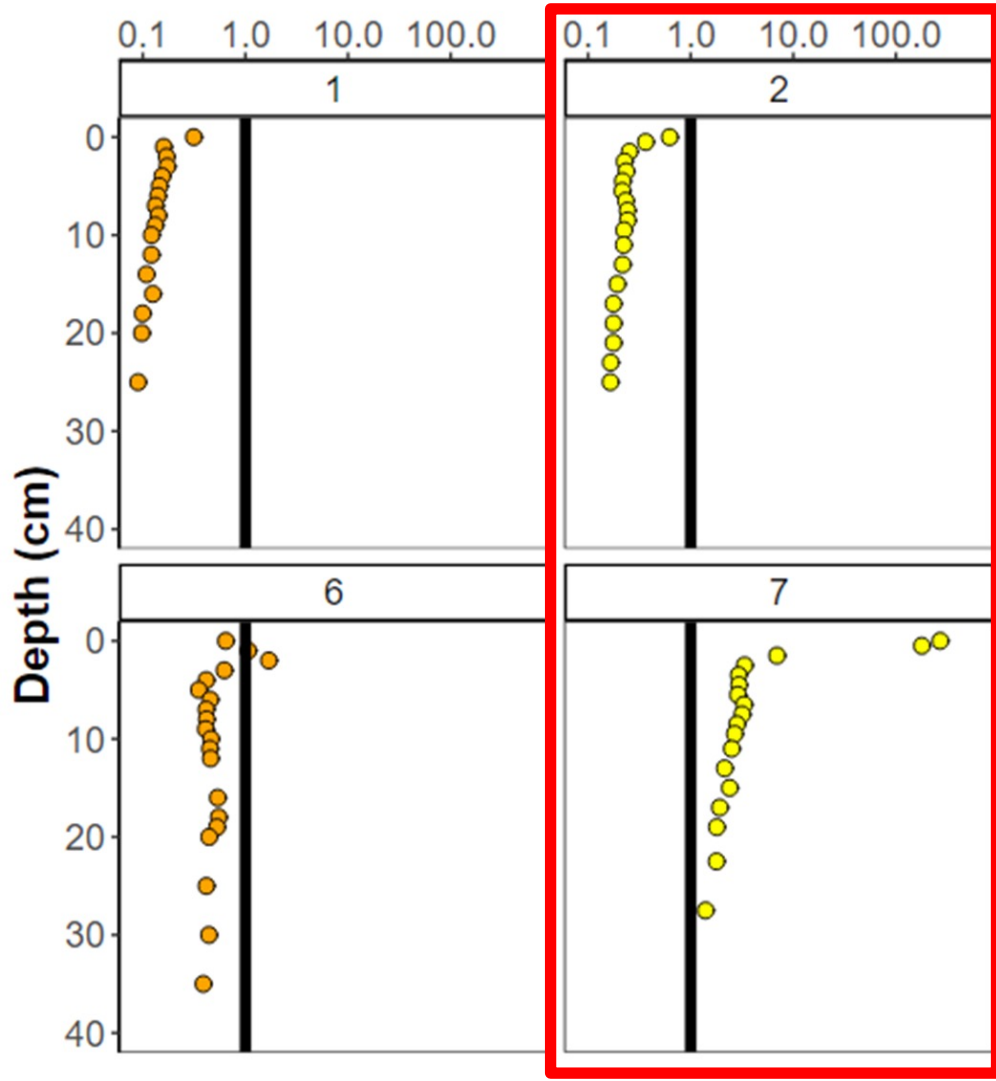

Dissolved Fe and Mn in Porewater

## Site 2

## Site 7

■ Mn  
● Fe

Citrate dithionite acetic  
acid extraction

# Reactive Fe and Mn near surface sediments

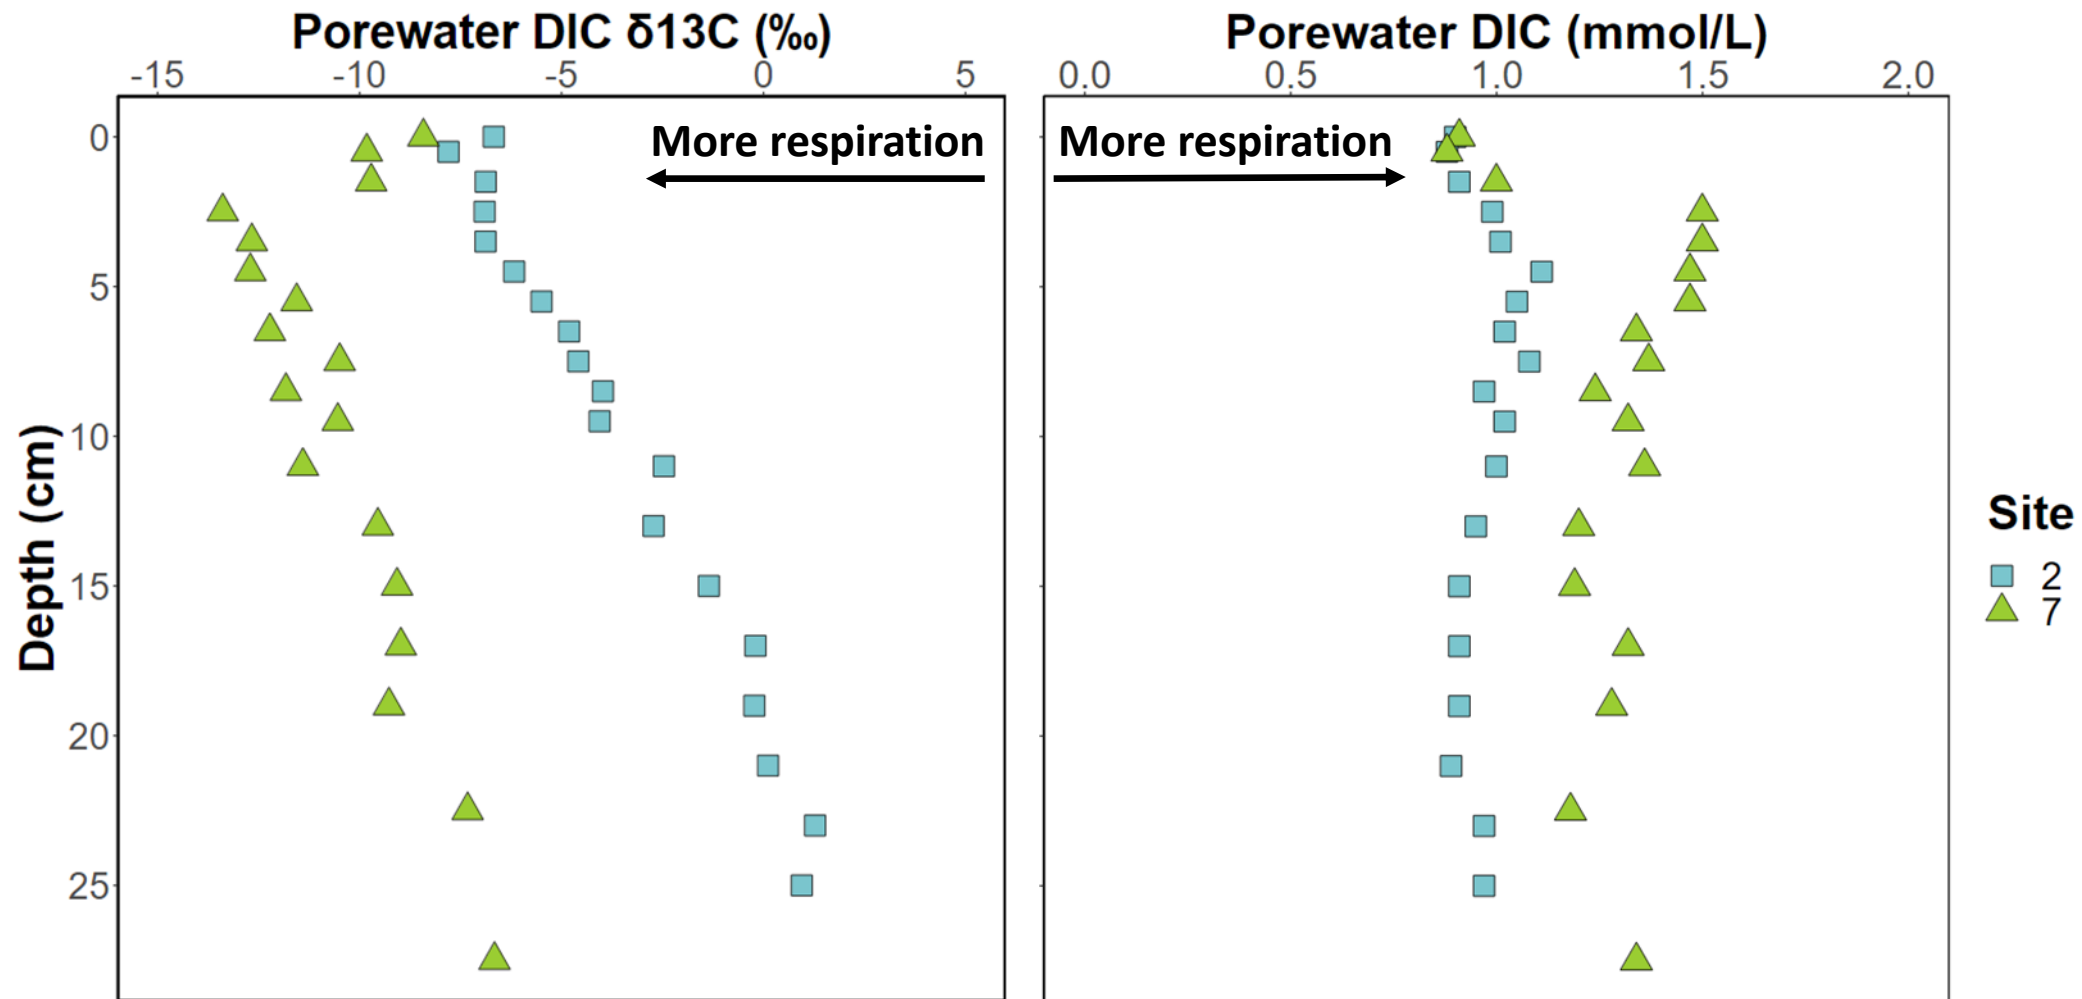

# Manganese/Iron Ratio

**These results allow us to investigate both Fe and Mn oxides separately to understand if they play a role in carbon stabilization or heterotrophic respiration within the lake.**

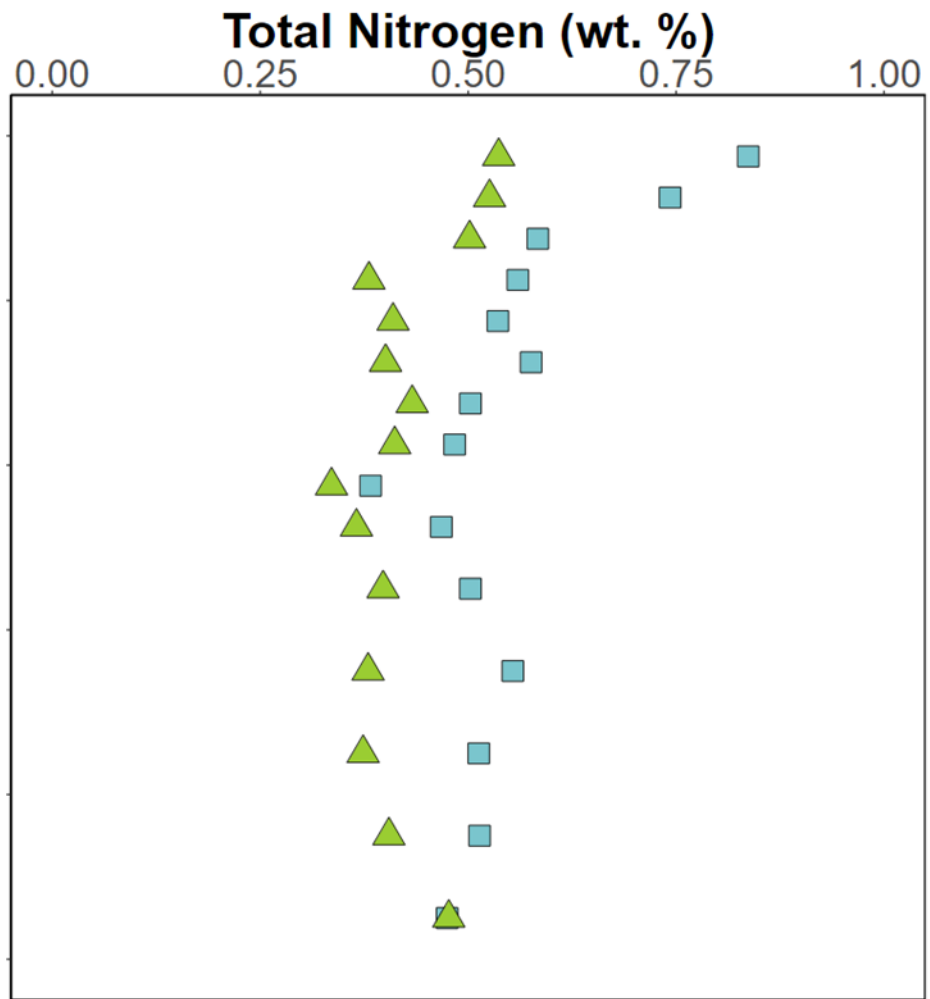

Porewater Dissolved Inorganic Carbon

TOC

TN

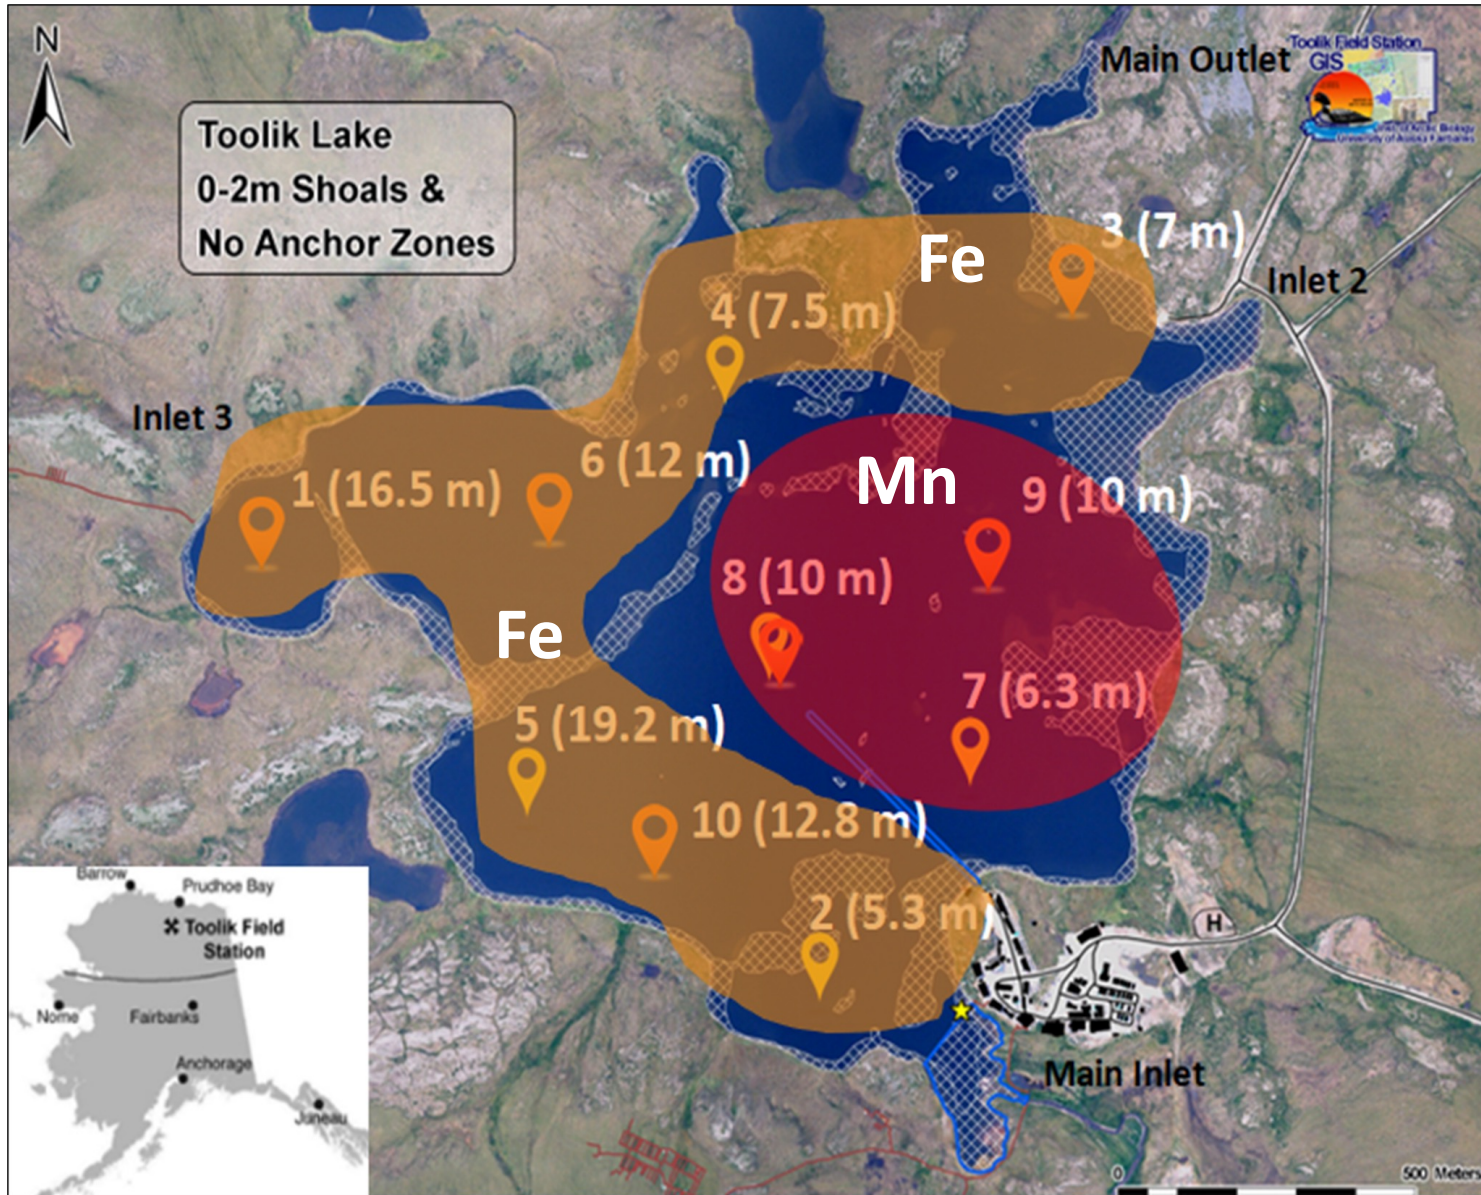

# Preliminary Findings

---

- Spatial variability in dominant metal signatures across the lake
  - Pocket of Mn dominated sites in the lake (sites 7-9)
- Variable heterotrophic respiration signatures
  - Site 7: higher heterotrophic respiration
- Variable concentrations of TOC and TN
  - Site 7: lower TOC and TN

# Preliminary Conclusions

Sites dominated by iron reduction appear to be stabilizing organic carbon while sites dominated by manganese reduction are fueling heterotrophic respiration and carbon degradation
